1953, James Watson and Francis  
Crick established the structure of  
DNA. The structure is a double  
helix, which is like a twisted  
ladder. The sides of the ladder are  
made of alternating sugar and  
phosphate molecules. The sugar  
is deoxyribose. Color all the  
phosphates pink (one is labeled  
with a "p"). Sun, 29 Apr 2018

Double Helix - Starkville Science  
Club - Double helix is the  
description of the structure of a  
DNA molecule. A DNA molecule  
consists of two strands that wind  
around each other like a twisted  
ladder. Each strand has a  
backbone made of alternating  
groups of sugar (deoxyribose)  
and phosphate groups. Tue, 22

James Watson and Francis Crick  
established the structure of DNA.  
The shape of DNA is a double  
helix, which is like a twisted  
ladder. The sides of the ladder are

made of alternating sugar and  
phosphate molecules. The sugar  
is a pentose called deoxyribose.

The Structures Of Dna And Rna -  
Biology - The two strands of the  
double helix are anti-parallel,

which means that they run in  
opposite directions. The  
sugar-phosphate backbone is on  
the outside of the helix, and the  
bases are on the inside. The  
backbone can be thought of as the  
sides of a ladder, whereas the  
bases in the middle form the  
rungs of the ladder. double helix
